1. We are given with a feedback voltage amplifier shown in 1.We can neglect r_o and given with $R_1 + R_2 >> R_D$.

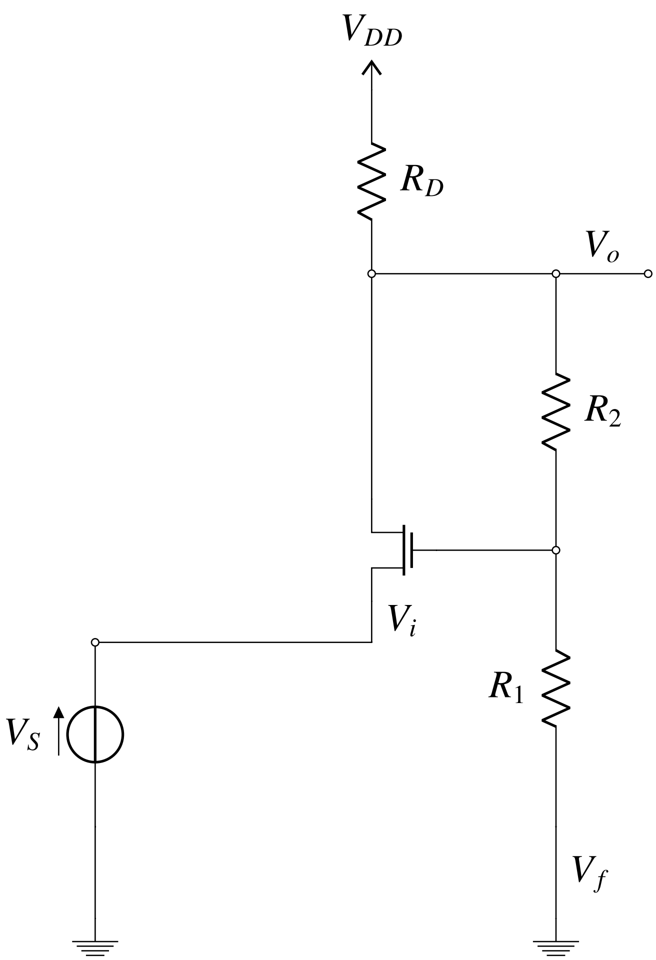

Fig. 1

2. part(a) : We have to find the expressions for G(open loop gain) , H(the feedback factor) and hence the amount of feedback.

*The author is with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in.

Solution: For this , first we have to draw the Small-Signal Model for the above Circuit, we ground all constant voltage sources and open all constant current sources. All Small-Signal paramters are obtained from DC-Analysis of the circuit.In Small-Signal Analysis a N-MOSFET is modelled as a Current Source with value of current equal to $g_m v_{gs}$ flowing from Drain to Source. Whereas a P-MOSFET is modelled as a Current Source with value of current equal to $g_m v_{sg}$ flowing from Source to Drain.

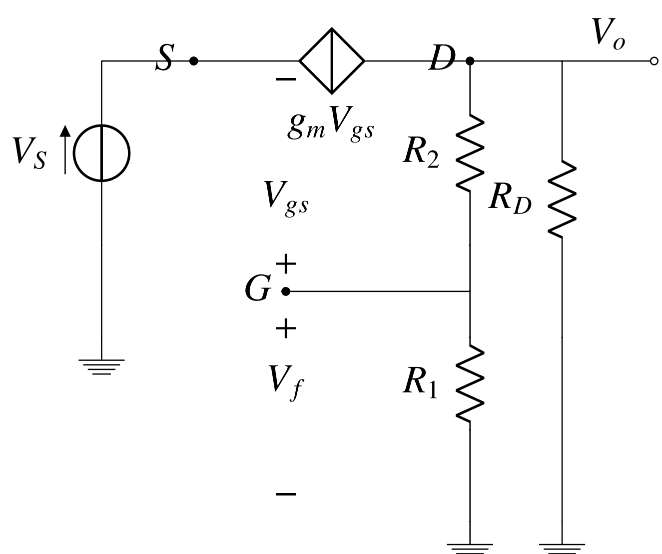

Fig. 2: Small Signal Model

3. For finding open loop gain (G) and the feedback factor (H).
Solution: For finding the open loop gain we have to remove R_2 and R_1 and the gate should be grounded.
4. Finding the open loop gain(G)

Solution:

$$V_o = -g_m V_{gs} * R_D \quad (4.1)$$
$$V_{gs} = -V_S \quad (4.2)$$
$$G = \frac{V_o}{V_s} \quad (4.3)$$
$$G = g_m R_D \quad (4.4)$$

5. Finding the Expression for the feedback factor H.
Solution:

$$H = \frac{V_f}{V_o} \quad (5.1)$$
$$V_f = \frac{R_1}{R_1 + R_2} V_o \quad (5.2)$$
$$H = \frac{R_1}{R_1 + R_2} \quad (5.3)$$

Amount of feedback is defined as : $1 + GH$

$$1 + GH = 1 + \frac{g_m R_D R_1}{R_1 + R2} \quad (5.4)$$

6. Part(b) : We have to eliminate the feedback by removing R_1 and R_2 and connecting the gate of Q to a constant DC voltage (signal ground).We have to find the expression of the input resistance R_i and the output resistance R_o of the open loop amplifier.
Solution:
When the R_1 and R_2 and gate of Q is connected to a constant DC voltage (signal ground) it becomes a CG(Common gate amplifier) without feedback. We can directly see from the **??** the expression of input resistance R_i and output resistance R_o.
For finding input resistance , output constant voltages are grounded and hence the only current flowing is $g_m V_{gs}$.Hence R_i is :

$$I_{in} = -g_m V_{gs} \quad (6.1)$$
$$V_{in} = V_S \quad (6.2)$$
$$V_S = -V_{gs} \quad (6.3)$$
$$R_i = \frac{V_{in}}{I_{in}} \quad (6.4)$$
$$R_i = \frac{1}{g_m} \quad (6.5)$$

Similarly , for finding output R_o , V_{in} that is V_S will be zero and hence $g_m V_{gs}$ will be zero. Hence only R_D will be left which is the output resistance.

$$R_o = R_D \quad (6.6)$$

7. Part(c) : Using standard circuit analysis that is without using feedback approach we have to find the input resistance R_{if} and output resistance R_{of} and how they relate to R_i and R_o , which we find earlier.
Solution:
We will find them one by one.

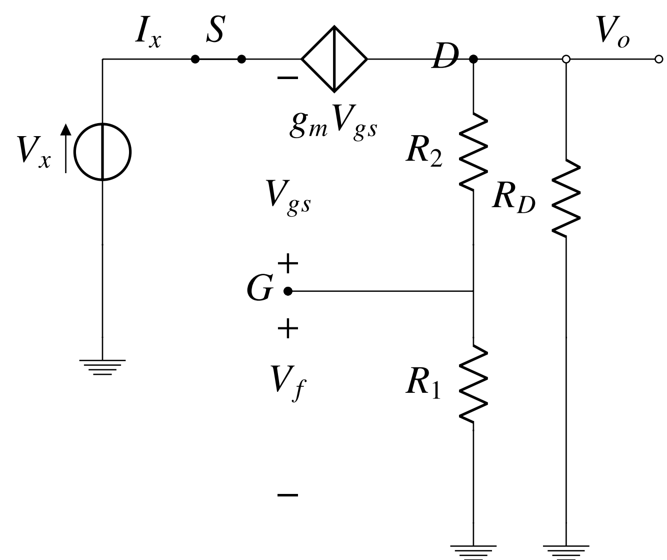

Fig. 7

8. finding expression for R_{if}
Solution:

To obtain R_{if} consider the figure 7 :
We gave test input voltage V_x and current I_x to find the input resistance from the input side to find R_i.

$$R_{if} = \frac{V_x}{I_x} \tag{8.1}$$

$$I_x = -g_m V_{gs} \tag{8.2}$$

$$V_o = I_x R_D \tag{8.3}$$

$$V_f = \frac{V_o R_1}{R_1 + R_2} = \frac{I_x R_D R_1}{R_1 + R_2} \tag{8.4}$$

$$V_x = -V_{gs} + V_f \tag{8.5}$$

$$V_x = \frac{I_x}{g_m} + \frac{I_x R_D R_1}{R_1 + R_2} \tag{8.6}$$

$$\frac{V_x}{I_x} = \frac{1}{g_m} + \frac{R_D R_1}{R_1 + R_2} \tag{8.7}$$

$$rearranging : \tag{8.8}$$

$$R_{if} = \frac{1}{g_m}(1 + \frac{g_m R_D R_1}{R_1 + R_2}) \tag{8.9}$$

$$R_{if} = R_i(1 + GH) \tag{8.10}$$

The input impedance is increased by a factor of $(1 + GH)$. R_{if} is related to R_i by :

$$R_{if} = R_i(1 + GH) \tag{8.11}$$

9. finding expression for R_{of}
Solution:

To obtain R_{of} consider the figure **??** :
We gave test input voltage V_x and current I_x from the output side to find the output resistance and made the input constant voltages as zero.

$$R_{of} = \frac{V_x}{I_x} \tag{9.1}$$

$$I_x = g_m V_{gs}(\frac{V_x}{R_1 + R_2}) + (\frac{V_x}{R_D}) \tag{9.2}$$

$$V_{gs} = \frac{R_1 V_x}{R_1 + R_2} \tag{9.3}$$

$$I_x = \frac{g_m R_1 V_x}{R_1 + R_2} + \frac{V_x}{R_1 + R_2} + (\frac{V_x}{R_D}) \tag{9.4}$$

$$I_x = V_x(\frac{g_m R_1 + 1}{R_1 + R_2} + \frac{1}{R_D}) \tag{9.5}$$

$$R_{of} = \frac{V_x}{I_x} \tag{9.6}$$

$$R_{of} = \frac{1}{\frac{g_m R_1 + 1}{R_1 + R_2} + \frac{1}{R_D}} \tag{9.7}$$

rearranging and multiply both the numerator and denominator by R_D

$$R_{of} = \frac{R_D}{\frac{g_m R_1 R_D}{R_1 + R_2} + 1 + \frac{R_D}{R_1 + R_2}} \tag{9.8}$$

since $R_1 + R_2 >> R_D \implies \frac{R_D}{R_1 + R_2} = 0$

$$R_{of} = \frac{R_D}{1 + \frac{g_m R_1 R_D}{R_1 + R_2}} \tag{9.9}$$

$$R_{of} = \frac{R_o}{1 + GH} \tag{9.10}$$

The output impedance is decreased by a factor of $(1 + GH)$. R_{of} is related to R_o by :

$$R_{of} = \frac{R_o}{1 + GH} \tag{9.11}$$

The table showing all the expressions we find out in this problem :

G	$g_m R_D$
H	$\frac{R_1}{R_1 + R_2}$
R_i	$\frac{1}{g_m}$
R_o	R_D
R_{if}	$(\frac{1}{g_m})(1 + \frac{g_m R_D R_1}{R_1 + R_2})$
R_{of}	$\frac{R_D}{1 + \frac{g_m R_D R_1}{R_1 + R_2}}$
